

Data Preparation Session 2

Exercises

Exercise 2.1

- a) Import the workstoppages.txt file from your working directory. Hint: find out the delimiter.
- b) Use glimpse to check the file structure.

Exercise 2.2

- a) Import the breakfast.xlsx file from your working directory (skip unnecessary rows, add variable names as needed).

Hint1: If it is not there, you can download from Courses, unzip, and copy to the right folder.

Hint2: Checking the file in Excel BEFORE the operation can be very helpful.

- b) Transform your values to logical units (persons instead of millions or thousands, decimals instead of percentages).

Hint3: mutate() can help.

Exercise 2.3

- a) Try to import the employees_broken.txt file. Figure out the type.
- b) Check what part of the file is not data, but metadata.
- c) For the import, use col_names = c("id", "name", "birthdate", "gender", "salary")
- d) List further problems (we will see solutions for additional problems later)
- e) Restart with the employees_broken2.txt file. Good luck!

Exercise 2.4

- a) Read the planets.xlsx file into a data frame *planets*.
- b) Calculate the average mass of the planets (use the mean function and subsetting data as you learned in Session 1).

Exercise 2.5

- a) Import the "database test.sav" file.
- b) Check the structure of this dataset. Compare the imported database as tibble, and as dataframe.

Exercise 2.6

- a) Read the Toronto project.xlsx file into a data frame *toronto*. Pay attention to import the data table, with standard variable names and skip empty rows at the beginning of the Excel worksheet.
- b) Remove the almost empty column (that has only a variable name).

Exercise 2.7

- a) Read the dogs.dta file using the right function in the tidyverse library.
- b) Glimpse it.
