

Data Preparation Session 5

Exercises

Exercise 5.1 (continued from Session 4)

- a) Read the coffeeshop.csv file to a data frame as it is using the tidyverse library. Do not change variable types and names.
- b) The data frame is not tidy. Explain what is wrong and why.
- c) Using pivot functions, restructure the data frame.
- d) Clean the first column, it should be named 'Beverage_category' and should have only text, but no ... or numbers.
- e) Check the unique values of Total fat and Caffeine. What problems do you see with them?
- f) Clean the Total fat. We should have numbers. Also, clean Caffeine, whenever more values are possible, just use NA. (Hint: this question is easy-to-understand if you solved e), otherwise... hmmm, good luck!)
- g) Change variable types, use numeric where it is possible to.
- h) Calculate the sugar content in grams of the drink with the highest caffeine level. (hard exercise) If you finish this exercise before the end of the class, raise your hand, and ask for as many bonus points as the right answer.

Exercise 5.2.

- a) Load the "dirty petal.csv" file.
- b) Propose a solution for the NAs using the information in the dataset only. Implement your proposal.
