

Session 8 Practice

--Start a new database and go. You have to create the relations. Here is the diagram and look for the data to insert in the Excel file:

-- Create a table employee. emp_id is the primary key. Variable types are INT, VARCHAR(40), VARCHAR(40), DATE, VARCHAR(1), INT, (INT, INT)

-- Because of data integrity issues, you have to add foreign keys later (super_id, branch_id)

--Create table branch; branch_id is the primary key, Variable types are INT, VARCHAR(40), INT, DATE

--As employee table already exists, we can define the foreign key (mgr_id) with reference to employee(emp_id)

--Add to table employee the super_id which is INT. It is the foreign key with reference to employee(emp_id)

--Add to table employee the branch_id which is INT. It is the foreign key with reference to branch(branch_id)

--Create table client; client_id is the primary key, Variable types are INT, VARCHAR(40), INT

--As branch table already exists, we can define the foreign key (branch_id) with reference to branch(branch_id)

--Create table works_with; the primary key is a composite of emp_id and client_id. Variable types are INT

--As employee table already exists, we can define the foreign key (emp_id) with reference to employee(emp_id)

--As client table already exists, we can define the foreign key (client_id) with reference to client(client_id)

--Create table branch_supplier; The primary key is a composite of branch_id and supplier_name. Variable types are INT, VARCHAR(40), VARCHAR(40).

--As branch table already exists, we can define the foreign key (branch_id) with reference to branch(branch_id)

-- See Session_8_practice_tables.xlsx for tables. Start with employees table, and David Wallace.

-- Attention, neither employees nor branch has entries, so you cannot set neither super_id nor brach_id see NULL

-- Insert the first branch Corporate

-- update the employee table with David's branch

--Insert Jan

--Insert Michael, attention to non-existing branch

-- Insert the first branch Scranton

-- Update Michael

--Insert Angela, Kelly, Stanley

-- Insert Josh, attention, his branch does not exist yet

-- Insert the necessary branch: Stamford

-- Update Josh

-- Insert Andy and Jim

-- Insert values to BRANCH SUPPLIER

-- Insert values to CLIENT

-- Insert values to WORKS_WITH
